ELECTRIC FENCING

AMC pulsed electrified perimeter security systems provide total security and protection of the protected perimeter or boundary.

The construction of the system creates a psychological and physical barrier through or over which would-be intruders would have to pass to achieve their objective. By design AMC systems actively Defend... Deter... Deny... Detect... attempts to gain unauthorised access!

Would-be intruders who come into contact with the system are repelled by a SHORT, SHARP, REGULATED SAFE but PAINFUL electric shock. Any attempts to cut, load, short-circuit or tamper with the fence are detected and alarms are generated

All components used for the construction of our systems fully comply with all National and International Standards including BSEN 60335. In addition we have our own Installation Standards and Code of Practice. AMC systems are designed to be fail safe and secure.

Systems are operated by up to 4 LCD remote keypad(s) for ease of use and text messaging of alarms and system status. User codes can be programmed to allocate individual user codes and privileges.

A real time event memory and alarm history log automatically records all events including the time and date when the system is armed, disarmed, and alarmed.

In the event of mains failure standby rechargeable batteries maintain the system armed for a minimum of 10 hours. Alarm relays are provided for each zone of protection for switching cameras, CCTV systems, security lighting or other local or remote alarm monitoring systems. Programmable electronic outputs are available for customised alarm requirements and mimic displays.

AMC electric fencing systems are ideal for use with CCTV remote monitoring and surveillance systems. Controls have an open system architecture to allow easy interfacing with other security systems, for full remote monitoring and control, including remote arming, disarming, system status and alarm reporting by zone.
