

## Height Restrictor Barriers

The fixed or 'swing' arm manual height restrictors are manufactured from high quality rectangular and circular mild steel sections. These units can be used to prevent access to unauthorised areas, such as staff car parks or underground car parks, where mandatory height restrictions apply.

A manual swing arm height restrictor is also available. Fitted with a latch release mechanism, which allows entry for authorised vehicles. This option can be locked in both the open and closed positions.

Units are finished in 'traffic yellow' as standard, other colours available on request. High visibility banding can also be fitted to both the uprights and crossbars for extra visibility. A suspended swinging crossbeam or 'nudge bar' is also available allowing for entrance of emergency vehicles. Non-standard and bespoke units can be manufactured to order.
