## ROCKFILL FENCING

AMC Rockfill fencing system is a modular dual wall steel fencing system which may be filled with rocks or masonry. This results in a very high security fence, which may also be used as a gabion in earth retention projects. It also has high acoustic screening properties.

Typical uses include perimeter protection at very high security sites, free standing walls, visual or wind break barriers, acoustic barriers, decorative and architectural features etc.

The fencing is manufactured from two 8mm horizontal steel wires either side of 6mm vertical wires, welded at each intersection. Steel ties tether the two faces of the fence against the pressure of the contained rocks. Steel posts are used at 2.5m centres to anchor the structure and provide resistance to lateral movement.

Available in heights between 630mm and 2030mm.
