

Tyre Killer

A clever combination of traffic flow control and speed control in one product.

Tyre Killer ramps comprise a one piece speed ramp with a series of tyre deflating teeth. Designed for high security installations, this product offers instant protection against vehicle intrusion into a protected area, whilst regulating the speed of authorised vehicles.

The ramp is simply bolted to a suitable concrete or asphalt roadway using expanding anchor bolts, and is totally self contained, requiring no power connections. The weight of vehicle tyres will retract the teeth across the width of the ramp.

Also available is a flush unit which is recessed into the road surface, and is suitable for use where speed control is not required.

Tyre Killer ramps are constructed from heavy gauge mild steel, with a galvanised finish. They may also be supplied in painted finish.

They are built to order to suit specific road widths and can be tailored to suit any application or location.
